

Indian Height-Weight Chart According To Age: A Comprehensive Guide To Health And Growth

In India, where diverse genetic backgrounds and lifestyles exist, it is essential to understand what is considered healthy for the general population. To this end, the Indian height-weight chart according to age provides an essential resource for tracking growth and development at different life stages and making well-informed lifestyle choices.

Sit back, relax, and dive into this engaging read that outlines the finer points of the Indian height-weight chart according to age, emphasising the various factors that influence our journey towards optimal health and well-being.

Factors Affecting Height And Weight

Genetics play a significant role in determining height and weight potential, but nutrition, lifestyle, and physical activity influence how this potential is realized. A balanced diet, exercise, and healthy habits impact growth and weight management. Medical conditions or hormonal issues can also affect height and weight.

Growth And Development In Different Age Groups

Growth rates vary among age groups. Infants and toddlers undergo rapid growth, followed by a slower pace until adolescence when hormonal changes trigger another growth spurt. Puberty occurs at different ages for boys and girls, resulting in distinct growth patterns. Height stabilizes in adulthood, while weight can still be influenced by nutrition, lifestyle, and physical activity.

Adults’ Average Height And Weight Chart By Age In India

Understanding the optimal height and weight ranges for adults is crucial for maintaining overall health and preventing diseases related to weight and metabolism.

1. Height And Weight Chart For Women

For women with a medium body frame, the ideal weight ranges from 45-59 kg for heights between 4'10" to 5'8".

An approximate height-weight ratio chart for adult women:

Height	Weight
4' 6" (137 cm)	63/77 lb (28.5/34.9 kg)
4' 7" (140 cm)	68/83 lb (30.8/37.6 kg)
4' 8" (142 cm)	72/88 lb (32.6/39.9 kg)
4' 9" (145 cm)	77/94 lb (34.9/42.6 kg)
4' 10" (147 cm)	81/99 lb (36.4/44.9 kg)

4' 11" (150 cm)	86/105 lb (39/47.6 kg)
5' 0" (152 cm)	90/110 lb (40.8/49.9 kg)
5' 1" (155 cm)	95/116 lb (43.1/52.6 kg)
5' 2" (157 cm)	99/121 lb (44.9/54.9 kg)

2. Height And Weight Chart For Men

For men with a medium body frame, the ideal weight ranges from 50-73 kg for heights between 5'4" to 6'0".

An approximate height-weight ratio chart for adult men:

Height	Weight
4' 6" (137 cm)	63/77 lb (28.5/34.9 kg)
4' 7" (140 cm)	68/84 lb (30.8/38.1 kg)
4' 8" (142 cm)	74/90 lb (33.5/40.8 kg)
4' 9" (145 cm)	79/97 lb (35.8/43.9 kg)
4' 10" (147 cm)	85/103 lb (38.5/46.7 kg)
4' 11" (150 cm)	90/110 lb (40.8/49.9 kg)
5' 0" (152 cm)	95/117 lb (43.1/53 kg)
5' 1" (155 cm)	101/123 lb (45.8/55.8 kg)

It is essential to note that these numbers are approximate and may vary for individuals with a small or large body frame.

The above charts, along with Body Mass Index (BMI), can give an overview of what is considered healthy in terms of an individual's weight in relation to their height. Its calculation is categorised as follows:

- BMI below 18.5: Categorised as being underweight.
- BMI between 18.5 and 24.9: Considered as a normal/healthy weight.
- BMI between 25.0 and 29.9: Categorised as being overweight.
- BMI of 30.0 or higher: Classified as obese.

While Body Mass Index (BMI) is commonly used, its accuracy in measuring health is contested among experts. Excess weight doesn't guarantee health issues, but obesity can increase the risk of related complications. To fully understand one's health and seek guidance, consult a healthcare provider.

Children's Average Height And Weight Chart By Age In India

For children, regularly tracking height and weight is even more crucial as it discerns any growth deviations early on, thereby ensuring prompt intervention.

1. An approximate height-weight ratio chart for female babies to toddlers (0-1 years):

Age	Weight	Length
0 Months	7.3 lb. (3.31 kg)	19.4" (49.2 cm)
1 Month	9.6 lb.. (4.35 kg)	21.2" (53.8 cm)
2 Months	11.7 lb. (5.3 kg)	22.1" (56.1 cm)
3 Months	13.3 lb. (6.03 kg)	23.6" (59.9 cm)
4 Months	14.6 lb. (6.62 kg)	24.5" (62.2 cm)
5 Months	15.8 lb. (7.17 kg)	25.3" (64.2 cm)
6 Months	16.6 lb. (7.53 kg)	25.9" (64.1 cm)
7 Months	17.4 lb. (7.9 kg)	26.5" (67.3 cm)
8 Months	18.1 lb. (8.21 kg)	27.1" (68.8 cm)
9 Months	18.8 lb. (8.53 kg)	27.6" (70.1 cm)
10 Months	19.4 lb. (8.8 kg)	28.2" (71.6 cm)
11 Months	19.9 lb. (9.03 kg)	28.7" (72.8 cm)
12 Months	20.4 lb. (9.25 kg)	29.2" (74.1 cm)

Please note the above charts are only approximating values. The maturation and growth process during the teenage years varies for each individual, including babies, children, and teenagers

Growing With Horlicks

[Horlicks](#) is an ideal nutritional drink for kids, providing essential nutrients for their overall growth and development. Clinically proven to improve five signs of child growth, Horlicks helps children become taller, stronger, and sharper. It offers bio-available nutrients that are easily absorbed and distributed throughout the body via the bloodstream.

With nine essential nutrients, including vitamins B6, B12, C, D, copper, folic acid, iron, selenium, and zinc, Horlicks supports immunity and concentration. It also aids in increasing the density of minerals like calcium in bones, promoting stronger and bigger bones. Clinically proven to enhance haemopoietic nutrients in the blood and increase fat-free mass, Horlicks is a delicious and convenient choice to support your child's overall health and well-being.
